## FORM FOUR PAPER 1

MARKING SCHEME
SECTION A ((3OMKS)

1. Seed dressing is the process of coating of seeds with insecticides or fungicides chemical to prevent the seed from soil borne diseases. ( $\mathrm{x} 1=1 \mathrm{mk}$ )

## 2. advantages of row planting

- Machines can be used easily between the rows.
- Easy to establish crop population.
- Low seed rate is used.
- Easy to carry out other operations like weeding, spraying and harvesting. ( $4 \mathrm{x} 1 / 2=2 \mathrm{mks}$ )

3. Factors considered when choosing site for tomato nursery.

- type of soil
- nearness to water source
- topography
- security
- previous cropping
- well sheltered place

$$
\left(4 \mathrm{x}^{1 / 2}=2 \mathrm{mks}\right)
$$

4. Reasons for treating water.

- To kill disease causing micro-organism
- To remove chemical impurities
- To remove dour / bad smell
- To remove foreign particles. $\quad(3 \times 1 / 2=11 / 2 \mathrm{mks})$

5. Effect of HIV/AIDS to agriculture.

- Loss of skilled labour through death of skilled personnel.
- Wastage of time in caring of patients.
- A lot of money is spent on treating people with HIV/AIDS.
- Government and NGOs' spend a lot of money to control HIV in expense of development ofagriculture.

$$
\left(3 \mathrm{x}^{1 / 2}=1 / 2 \mathrm{mks}\right)
$$

## 6. Advantages of overhead irrigation.

- Eradicate pests e.g. Aphids.
- Minimizes wastage of water.
- Can be used in sloppy areas.
- Water is evenly distributed.
- Can irrigate a large area by changing the location of pipes.
- Foliar fertilizers can be applied using this method $\quad(4 \mathrm{x} 1 / 2=2 \mathrm{mks})$

7. Ways of conveying water in the farm.

- piping
- canals
- containers $\quad\left(3 \mathrm{x}^{1 / 2}=1 \frac{1}{2} \mathrm{mks}\right)$

8. A farmer in PREMIER was advised to apply 150 kg CAN/ha, while top Dressing the maize crop.CAN contain $21 \% \mathrm{~N}$. Calculate the amount of nitrogen applied/ha.

$$
\begin{align*}
& \text { If } 100 \mathrm{~kg} \text { of C.A.N } \rightarrow 21 \mathrm{~kg} \mathrm{~N} \\
& 150 \mathrm{~kg} \text { of C.A.N } \rightarrow ? \\
& =\frac{150 \mathrm{~kg} C \cdot A \cdot \mathrm{~N} \times 21 \mathrm{kgN}}{100 \mathrm{~kg} C \cdot A \cdot \mathrm{~N}} \\
& =31.5 \mathrm{~kg} \mathrm{~N} / \mathrm{ha}
\end{align*}
$$

## 9. Opportunity cost is zero.

- When the item is free.
- When the item is plenty
- When the item has no alternative

10. Importance of tissue culture

- mass production of prop gules
- Establish pathogen free plants
- Establish fast.
- $\quad$ Requires less space.

11. Principles of agriculture.

- Law of opportunity cost
- Law of diminishing returns
- Law of profit - maximization.
- Principle of equal-marginal returns.
- Principle of substitution

## 12. Problems facing marketing of cabbages.

- Perish ability of cabbages.
- Poor transport
- Lack of marketing information.
- Change of market prices.
- Change of government policy.

$$
\left(4 x^{1 / 2}=2 \mathrm{mks}\right)
$$

13. Variable costs

- cost for fertilizers.
- Cost of chemicals.
- Wages.
- Cost of fuel.
- Cost of planting seeds. $\quad(4 \mathrm{x} 1 / 2=2 \mathrm{mks})$

14. Constituents of soil

- soil air
- soil water
- soil micro-organisms
- soil particles
- Soil organic matter/humus.

## 15. Product-product relationship

- joint products
- competitive products
- complementary products
- $\quad$ Supplementary products. $(4 \mathrm{x} 1 / 2=2 \mathrm{mks})$

16. Topping - is removal of fibrous materials from the pasture after harvesting or grazing pasture while top-dressing is the application of fertilizers at the base of the pastures. ( 2 mks ) (mark as whole)

## 17 factors which influence spacing of crops

- type of soil
- growth habit
- soil fertility
- soil moisture
- number of seeds per hole
- use of the crop
- Occurrence of pests and diseases.

$$
\left(5 x^{1 / 2}=21 / 2 \mathrm{mks}\right)
$$

## SECTION B ( 20MARKS)

18 a)

b) - Poisonous to livestock

- Competes with crops for nutrients / light / water or space
- Increase cost of production
- Lower yields / quality $\mathbf{1 x 1}=1 \mathbf{m k}$
c) -Enables land owners / landlord to earn income from land
- Enable people who have no land to have acres to farmers land
- Idle land put into productive use
- Enable tenants to increase / decrease acreage of land leased depending on profitability
$x 4=(2 m k s)$
19 - Read the label / manufacture instructions and follow them
- Measure the required amount of fungicide
- Place the fungicide into a container and mix thoroughly with a little water / pre-mix (pre-cream) until it forms a uniform slurry
- Pour the mixture into the knapsack sprayer through the sieve
- Top up / add up to the required level on the knaprack sprayer
- Spray the mixture onto the cap as required

Observe the procedure
20)a) Root prunning / trimming
b) - Build up of strong rooting system / compact system .

- Encourage formation of lateral roots
- Make lifting easy
- Prevent root damage
- Increase survival rate during transplanting

```
*
```

    \(=3 \mathrm{mks}\)
    c) - To prevent soil erosion / water run off

- Prevent roots from being exposed
- Protect seedlings from damage

2 mks
21) a) Elasticity of Demand $=\frac{\% \text { change in Quality Demand }}{\% \text { change in price }}$

$$
\text { ie ED } \quad=\frac{\% \Delta \text { in } \mathrm{QD}}{\% \Delta \text { in } \mathrm{P}} \sqrt{ }
$$

$\%$ change in $\mathrm{QD}=\left(\frac{22-20}{20}\right) \times 100=\frac{2}{20} \times 100=10 \% \sqrt{ }$
$\%$ change in price $=\left(\frac{800-100}{1000}\right) \times 100=\frac{10}{-20}=-20 \% \quad($ mark as a whole $)$
$\mathrm{ED}=\frac{10}{20}=-0.2 \sqrt{ } \quad($ Mark as awhole $)$
b) Inelastic demand (i.e. since ED is less than 1)

## SECTION C ( 40 marks)

22.a)

- Pick flowers selectively
- Pick flower with horizontal petals / three to two roses of disk florets
- Use fore finger and thumb
- Pick by twisting the lead so that no stem is left attached
- Put the pricked flowers in woven baskets

$$
=(4 m k s)
$$

- Picking starts 3-4 months after planting
b) - Picked flowers are put in woven baskets to allow ventilation and avoid fermentation
- Wet flowers should not be picked since they heat up and ferment
- Should not be comp[acted to avoid heating up and fermentation
- Suitable picking intervals 14 - 21 days to avoid overgrown or young flowers
- Break flower stalks to maintain quality $1 x 6=6 \mathrm{mks}$

## 23 a) Land preparation

- Clear the land to remove all stumps
- Dig, plough the land to remove perennial weeds / roots
- Harrow the land ; to a fine filth
- Prepare the land during the dry season / before the rains $1 \times 5=5 \mathrm{mks}$
b) Pasture establishment
- Select a desirable variety of grass for the ecological condition / select the correct variety for the same zone
- Plant or the onset of rains / plant early
- Use certified seeds
- Drill / broad cast the seeds evenly
- Apply phosphatic fertilizers or appropriate rate
- Use ssp rate of 200-300 kg/ ha
- Use recommended seed rate for the variety
- Use $1.5-2 \mathrm{~kg} / \mathrm{ha}$ PGS $/ 5-10 / \mathrm{ha}$ for any available seed
- Drag a twig / gunny bag to cover the seeds lightly
- Cover seeds 3-5 times the diameter of seeds / depth $1 x 8=8 \mathrm{mks})$
c)Maintenance
- Control weeds by uprooting /use herbicides
- Top dress with nitrogenous fertilizers
- Top dress with nitrogenous fertilizers
- Top dress in split application
- Cut / graze in the initial stage when 4-6 months
- Control pests and diseases when they appear
- Avoid grazing when too young / Early defoliation
- Topping posture using appropriate method when to stemmy
- Carry out controlled grazing
- Irrigate when desirable
- $\operatorname{Re}-$ seeding when need $\boldsymbol{b} \boldsymbol{e}$

24a) - What extra coats will be involved in the change

- What costs will be saved
- What extra revenue from the change
- What revenue will be fore gone
- Is the change worthwhile
- 

b) - When replacing one enterprise with another

- When expanding are enterprise to the expense of another / reduce another
- When introducing an enterprise which is subsiding to the existing one
- When replacing one technique of production with another
- ( $1 \times 4$ ) $=4 \mathrm{mks}$
c)

(EXTRA REVENUE +COST SAVE) - (EXTRA COSTS +REVENUE FORGONE)

If mzee mkulima replace maize for beans he will experience a lose of 14750 so he should not replace maize with beans.
